STANDLEE FEED CALCULATOR™

Standlee Premium Western Forage® highly recommends feeding the highest quality forage to optimize your horse's health. The horse's digestive system is designed to digest forage, so it makes sense to make forage the most important ingredient in the diet. With any horse, the more quality forage fed the healthier the animal which ultimately translates into fewer veterinary bills. If feeding grain and too much is fed, horses may experience digestive upset (colic), gastric ulcers or even laminitis.

Replacing low to moderate quality hay with Standlee Premium Western Forage® will provide horses with additional nutrition. If feeding grain, this will often result in feeding less grain to maintain the same body weight. Our goal is always a well-fed healthy horse.

If you have not determined your horse's optimal forage type, use the [Standlee Forage Finder™](#) to do so.

Please input your horse's information below.

The Healthier Diet For Your Horse

The following is your horse's healthier diet with Standlee Premium Western Forage®. This diet is calculated to maintain your horse in the same body weight.

- 15.0 lbs. of Current Grass Hay
- 5.0 lbs. of Standlee Alfalfa Forage
- 3.8 lbs. of Grain

Your horse's new diet can eliminate 1.2 lbs. of grain per day.

Standlee strongly recommends feeding high quality forage at a minimum rate of 1.5% to 2.5% of body weight per day.

For your horse, this equals to 16.5 lbs. to 27.5 lbs. of forage per day.

Standlee recommends consulting with your veterinarian or nutritionist when changing your horse's diet. Please contact Standlee Premium Western Forage® at 800-398-0819 or at www.standleeforage.com with any questions.

The Standlee Feed Calculator™ calculates the above results using the average nutritional values of low to moderate quality hay by type (Alfalfa, Grass, & Mixed) and grain across manufacturers. For more accurate results, Standlee recommends sending your current hay and grain to a feed analysis laboratory.
